

Garhauer Marine,

I am enclosing some measurements and pictures in an effort to facilitate the fabrication of a new traveler system for our 36' sailboat. Our previous traveler system was lost in the mail and thus we will need to have a replacement (MT-2CT-TP, without the cam cleats on the control ends) made based solely on the enclosed template and the following measurements.

Our original system I believe was a Micro Fico X-Track, model number 610. Here is a picture before it was removed:

The total length of the traveler system (track length plus the control ends) is 5 feet. The curvature of the cabin top over that five foot length encompasses a drop at each end of $1\frac{13}{16}$ ":

I am also including a "template" for the hole positions. I believe the original Micro track had holes spaced at 4" centers. However the control ends were not integral to the track so they utilized two fasteners to attach them to the cabin top:

The holes drilled into the cabin top for securing the control ends can be seen here:

On the template provided we did not include the second hole (labeled 2 in the above picture). I believe the original track was secured using 1/4" fasteners.
